PERFIT VPS Impression Materials.

Professional precision for all indications.

After more than 10 years of practice in the market, PERFIT has developed into one of the most successful and popular impression materials in the world. HUEG continues to enhance its product range to meet the different needs of dentists. You can rest assured you'll find the right impression material for professional precision in the **PERFIT family**.

Perfect Precision For **Complex Impressions**

With an ideal combination of flowability and stability, PERFIT Heavy Body and Light Body can remain at the application site. They are the perfect material for **implant impressions** and **full denture impressions**.

Excellent hydrophilicity and thixotropy

PERFIT impression material is highly hydrophilic. It has an excellent ability to flow in wet areas and accurately reproduce details. Excellent thixotropy ensures that the material does not easily drip from the teeth. It brings a comfortable experience to patients.

Excellent dimensional stability

PERFIT impression materials have a low volume shrinkage and excellent dimensional stability. This dimensional stability ensures that the impression shape can be preserved for **28 days**, which is convenient for dentists and laboratory technicians.

"Snap-Set" Technology

PERFIT provides faster curing efficiency. It has sufficient working time and shorter intraoral setting time, which not only facilitates the clinical operation of dentists, but also brings a comfortable clinical experience to patients. And the faster cross-linking time reduces the inaccuracy caused by micro-movement.

Coordinated handling properties

Due to its excellent elastic memory, the material can be easily removed from the mouth and returns to nearly its original shape after removal. PERFIT products are available in various hardness levels, giving dentists multiple options to help them achieve the desired impression.

Clear details and
high precision

No bubbles

Continuity of the gingival margin

» I've used this material for 6 months, it's easy mix and accurate dosing of the base and catalyst due to their homogeneous no taste and smell. I like the density of the material too, there was no pores.

— Dr. Hanna Zielinska

Impression

Clinical evaluation and feedback

Evaluation Summary:

"Great detail and handling. Excellent hydrophilic property."

"The ease of loading and consistency of this impression material are very good."

"Very clean impressions, less bubbles."

— Comments from Dental Advisor Evaluators

» I'm very satisfied with the material, especially the high hydrophilicity and excellent adhesion between layers. One impression can be cast several models and still has good resistance to deformation.

— Dr. Andrey Zakharenko

PERFIT Regular Body-Transparent

Elastomeric Impression Material

For Clinical Application:

- 1. Two-step impression technique with wash materials
- 2. Light-curing guide for
 - a. Mock up restoration
 - b. Bonding of orthodontic brackets
 - c. Occlusal stamp for composite restorations

For Lab Application:

Composite injection moulding technique

Extreme Transparency

No bubbles

Ideal Rigidity

High Aesthetic Results

Technical Parameters

Technical Parameter	Regular Body
Working Time	1min30s
Setting Time in oral cavity	3min00s
Shore A Hardness (24 h)	62
Color	Transparent

Comparison

PERFIT Regular Body in comparison to competitors: From the comparison, it can be clearly seen that HUGE Regular Body has better transparency. And it rarely produces air bubbles and has high aesthetic effect.

HUGE Brand A Brand B Brand C

Clinical Application Case

The matrix created with PERFIT Regular Body achieves excellent aesthetics. In a short period of time, it can simplify clinical procedures and increase operational efficiency.

Indirect MOCK-UP Technology for aesthetic restoration

1. Prepare teeth and make the plaster model

2. Finish restoration with wax on plaster model

3. Apply Regular Body to the plaster model

4. Use Regular Body to make transparent matrix

5. Fill the space with light-curing resins

6. Light cure the resin materials

7. Finish restoration after polishing

PERFIT Bite Registration

Scannable Bite Registration material for digital workflows.

PERFIT Bite Registration is an addition silicone, which can be used for conventional bite registration techniques in conjunction with indirect restorative procedures. It is also a scannable material that can be used for the optical recording of data when fabricating restorations with **CAD/CAM systems**.

High final hardness

Due to the material's high final hardness of **90 Shore A** and high fracture toughness, PERFIT A Silicone for Bite Registration is easy to trim and grind. The high final hardness is particularly important for repositioning the bite registration between the models in the articulator. This is the only way to ensure perfect-fit restorations.

Fast setting time

The intraoral setting time of the fast type is 45 seconds. It provides patients with a pleasant impression recording experience, improves acceptance rate, and thus reduces the risk of inaccuracy. At the same time, it provides ample working time for full-mouth bite recording.

Scannable

PERFIT Bite Registration is a scannable bite registration material that is suitable for both universal bite registration and powder-free optical data recording of the antagonists for CAD/CAM technology, e.g. for fabrication of all-ceramic restorations.

Whipped-cream-like consistency

The consistency similar to fresh cream makes it easy for patients to bite. It is not easy to flow and has a certain bite resistance, which brings a good clinical experience to patients.
